The figure displays the evolution of the average number of nodes in the largest component for six different channels (Ch 104 to Ch 107) over 175 iterations. The x-axis represents the iteration number, ranging from 0 to 175. The y-axis represents the average number of nodes, ranging from 0 to 100. All channels show a rapid increase in the number of nodes in the largest component, reaching a plateau around iteration 25. Ch 104 (blue) achieves the highest average number of nodes, stabilizing at approximately 95. Ch 107 (red) stabilizes at the lowest average number of nodes, around 85. The other channels (Ch 105, 106, 107) cluster between 88 and 92.

Iteration	Ch 104	Ch 105	Ch 106	Ch 107
0	0	0	0	0
25	90	88	90	85
50	92	90	90	85
75	93	91	90	85
100	94	91	90	85
125	95	91	90	85
150	95	91	90	85
175	95	91	90	85

The figure displays the time evolution of the expectation value of the Pauli matrix σ_y for six different channels (Ch 128 to Ch 131). The x-axis represents time in units of 10^{-10} s, ranging from 0 to 175. The y-axis represents the expectation value, ranging from -0.5 to 0.5. All six channels show a constant value of approximately 0.05 throughout the entire time range.
